Lecture 2-5 — DOM Selection & Style

This page shows basic DOM selection methods and how to change element styles from JavaScript. It is for beginners who are just learning how to pick elements and change how they look.

Code Example

```
// Select elements
var box = document.querySelector('#box');
var btnColor = document.querySelector('#btnColor');

// Change styles using the style property
btnColor.addEventListener('click', function(){
    box.style.backgroundColor = 'lightblue';
    box.style.color = '#003366';
    document.getElementById('out').innerText = 'backgroundColor: ' +
box.style.backgroundColor;
});

// You can also use classList to add predefined styles
document.querySelector('#btnClass').addEventListener('click', function(){
    box.classList.toggle('fancy');
    document.getElementById('out').innerText = 'classes: ' +
box.className;
});
```

Interactive Example

This is the box. Click buttons to change me.

Change Color

Toggle Fancy

Output:

(no actions yet)

Explanation (for beginners)

- `**querySelector**`: picks the first element matching a selector (e.g., an id like `#box`).
- `**style**`: lets you set inline styles (e.g., `element.style.backgroundColor = 'red'`).
- `**classList.toggle**`: a safe way to add/remove CSS classes defined in stylesheet.
